

php js 都可以抓網址的變數資料

```
$input = $_GET ;
```

```
const $_GET = Object.fromEntries(new
URLSearchParams(window.location.search).entries());

console.log('$_GET', $_GET);
if ($_GET) {

    msgSpan.text($_GET.msg);
    msgBox.show();

}
```

JavaScript

```
// 直接包裝成一個類似 PHP $_GET 的物件
const $_GET = Object.fromEntries(new URLSearchParams(window.location.search).entries)

// 使用 jQuery 讀取並操作 DOM
$(document).ready(function() {
  let dataVal = $_GET['data']; // 取得 data 參數

  if (dataVal) {
    $('#my-element').text(dataVal); // 用 jQuery 把值塞進 HTML
  }
});
```
